

Technical Process and Philosophy

Technical engagements with Double Line Partners are based upon the following “formula:”

- Close collaborations with our clients throughout the process
- Focus on building a highly capable team that matches the specific tasks and challenges to be tackled
- Iterative development of deliverables and software with frequent opportunities for client feedback
- Test-driven software development with continuous integration that maintains a working and testable version of the software as new features are added
- “Wrapping” the agile development process with a more conventional project management structure that provides the necessary flexibility to respond to specific technical challenges while keeping close eye to meeting contractual requirements, budgets, and milestones, as depicted the following diagram
